MEMORANDUM FOR SURGEON GENERAL OF THE ARMY
SURGEON GENERAL OF THE NAVY
SURGEON GENERAL OF THE AIR FORCE
MEDICAL OFFICER OF THE MARINE CORPS

SUBJECT: Symptom Management in Mild Traumatic Brain Injury

Mild traumatic brain injury (mTBI) remains a serious health concern for all Service members. To mitigate the consequences of mTBI, we must ensure the most up-to-date clinical guidance is available to providers and employ consensus-based recommendations for medical management.

The medical management of mTBI is a rapidly evolving area of clinical practice. On October 29, 2007, the Deputy Assistant Secretary of Defense for Force Health Protection and Readiness published “Clinical Guidance for mTBI in Non-Deployed Medical Activities.” The enclosed guidance updates that guidance.

In creating this guidance, the Defense and Veterans Brain Injury Center (DVBIC), of the DoD Center of Excellence for Psychological Health and Traumatic Brain Injury, convened a workgroup to address the special issues identified in mTBI care. The interdisciplinary workgroup had Services and civilian representation and provided expert opinion in the following areas:

- Assessment
- Imaging
- Evaluation of visual complaints
- Evaluation of balance and hearing complaints
- Medication management
- Specialty referral
- Duty restrictions
Until the more detailed DoD/VA evidence-based guideline is available, the enclosed document provides clinicians with clear, concise guidance for mTBI specific complaints. DVBIC is developing an educational plan to facilitate use of this tool by primary care clinicians and the educational product should be available in June 2008. Please provide the attached guidance to providers as soon as possible for immediate use.

Ellen P. Embrey
Deputy Assistant Secretary of Defense
Force Health Protection and Readiness

Joseph Kelley
Deputy Assistant Secretary of Defense

Updated Mild Traumatic Brain Injury (mTBI) Clinical Guidance

Symptom Management in Mild Traumatic Brain Injury

With the increased awareness of mild traumatic brain injury (mTBI) or concussion, many military healthcare providers find themselves treating patients without formal training in neurotrauma. Although the majority of patients with mTBI recover quickly with minimal intervention, there is a subset that develops lingering symptoms that interfere with social and occupational functioning. Following multiple provider requests for assistance in managing this patient population, the Defense and Veterans Brain Injury Center convened an interdisciplinary work group with armed Services and civilian representation to evaluate the current literature regarding mTBI and in the absence of supporting literature, provide expert guidance regarding appropriate management of the symptomatic mTBI patient in the military setting. Areas of foci for this meeting were assessment, medication therapy, other treatment to include specialty referrals, and duty restrictions. Consensus-based recommendations are compiled in this report.

Assessment

The overarching goal of assessment is to identify those patients who may be at risk for traumatic brain injury (TBI), minimize the impact of secondary effects, improve treatment outcome, optimize mTBI care, and to ultimately reduce disability. Since patients with mTBI may not come to clinical attention for a variety of reasons, the purpose of assessment may vary slightly based on the timing of presentation following injury. See algorithms for Clinical Management Guidance for mTBI Acute and Sub-Acute (Attachment 1).

**Acute (injury to seven days) vs. Sub-acute (8-90 days)/Chronic (>90days)**

Assessment is symptom triggered, therefore leading to a focused exam. Domains required during the assessment of mTBI include but are not limited to the following:

**History:** Incident, mechanism, acute injury characteristics, course

**Symptoms:** Systematic inventory (may be facilitated by use of Suggested Tools for Evaluation – Attachment 2)

**Neurologic exam:**
- Cranial nerve exam (focused)
- Postural stability/vestibular exam (Dix–Hallpike maneuver, Romberg’s test)
- Visual function (gross acuity, eye movement, binocular function, visual fields, visual inattention)
Updated mTBI Clinical Guidance – May 8, 2008

Neurocognitive function: Mental status screening, neuropsychological testing, Military Acute Concussion Evaluation (MACE)
Psychological function: Depression, Post-Traumatic Stress Disorder (PTSD), neurobehavioral (Suggested Tools for Evaluation – Attachment 2)

Imaging studies are not necessary for all mTBI patients. The absence of pathologic signs on computed tomography (CT) does not preclude the presence of mTBI. Indications for CT scanning in the acute phase include drug or alcohol intoxication, physical evidence of trauma above the clavicles, age > 60yrs, seizure, headache, vomiting, and coagulopathy (Haydel, 2000). Structural magnetic resonance imaging (MRI) has a low incidence of positive findings in mTBI (Lewine, 2007). It is contra-indicated in patients with shrapnel and is of limited use with acute mTBI. MRI, single photon emission computed tomography (SPECT) and functional MRI (fMRI) may be more useful for patients who manifest symptoms of cognitive dysfunction after the acute phase has passed. It is recommended that advanced imaging techniques including but not limited to SPECT and fMRI be used only after consultation with a radiologist and a TBI specialist.

Medication Therapy

There is little level 1 evidence to guide pharmacologic treatment in the mTBI patient. Therefore, these recommendations are made based on available evidence and expert opinion. Concussion Management Grid chart (Attachment 3) and the Headache chart – (Attachment 4) list medication recommendations for common mTBI complaints. When considering pharmacotherapy, these principles should be considered:

- Population under consideration- mTBI patients with persistent symptoms (> seven days post-injury)
- Recognition of important premorbid/comorbid conditions or “red flags”
- “Start low and go slow” (low dose with slow titration)
- Initiate medications one at a time, allow an appropriate interval for effect, and titrate to effect
- There is a complex relationship between mTBI symptoms (sleep, headache, cognition, mood) and it is clinically reasonable that alleviating/improving one symptom may lead to improvement in other symptom clusters.

Specialty referral can be considered after failed trials of two or more medication classes at maximum tolerated dosing. In addition, specialty referral should be done immediately upon recognition of any “red flag.”

Therapy

It is strongly recommended mTBI treatment should involve an interdisciplinary team and should be guided by a comprehensive brain injury and mental health assessment. Referrals for physical therapy, occupational therapy, speech & language pathology, pharmacy, audiology/vestibular and optometry can be made at anytime. If cognitive rehabilitation is indicated, it should not be initiated until other medical issues are stabilized and pain is
adequately managed. Symptom-specific interventions may need to be modified to accommodate cognitive, sensory, or mechanical limitations of the patient. Further investigation regarding the timing and components of cognitive rehabilitation are warranted.

Novel therapy (hyperbaric oxygen, nutritional supplements) in the management of mTBI are being explored in the field as potential treatment approaches. It is the recommendation of this panel that interventions which lack sufficient empirical support, should occur only under the auspice of an Institutional Review Board (IRB) reviewed protocol. However, complementary techniques such as acupuncture may be used at the discretion of the provider and patient.

Since the acceleration/deceleration TBI literature documents increased frequency of alcohol and substance abuse in the TBI patient, it is recommended that appropriate screening be instituted for all patients diagnosed with mTBI (Suggested Tools for Evaluation – Attachment 1). Educational materials should be provided to all patients and their families about TBI and the issues related to substance abuse. Those with known alcohol or substance use problems should be referred immediately for counseling and/or treatment.

Formal neuropsychological testing is ideally done prior to the initiation of formal cognitive rehabilitation in order to guide the treatment plan. However, testing may be done anytime in assessment and management of mTBI and may be required during the course of a medical board evaluation. Neuropsychological testing may also be useful following the completion of a rehabilitation plan to evaluate outcomes. Treatment need not be delayed while awaiting neuropsychological testing.

Follow-up for the patient with mTBI is based on the individual plan of care. After initial evaluation, the asymptomatic patient should have follow-up within three to six months. This may be done by telephone. The frequency of follow-up is clinically determined to meet the individual plan of care. Symptomatic patients should be followed every two to four weeks from the time of initial contact. Symptomatic patients may be seen more frequently than two to four weeks while those who are stable may be seen less frequently. It is recognized that patients may transfer duty stations while still undergoing treatment for TBI. In such situations, the profile/limited duty or transfer of care note should clearly specify follow-up needs. Case managers need to arrange the services the patient will need for continuity of care in the community/command in which the patient will reside.

**Duty Restrictions**

Currently, there is variability among the Service branches in recording duty restrictions for Service members with TBI. Duty restrictions should be informed by the patient’s symptoms and progressively task the individual toward return to full duty. In the sub-acute phase (>seven days), symptomatic patients should be considered for limited duty hours to facilitate brain recovery. Progressive physical activity should be encouraged and monitored to the maximum tolerance of the patient without precipitating symptoms. Restricting the work environment and activities (i.e. driving, airborne operations, weapons, working at heights, combatives) further protects the Service member from risk of secondary injury or re-exposure and helps ensure the safety and welfare of others. The stress of complex leadership
positions may also complicate or exacerbate functional deficits, and may also be considered for limitation. This facilitates TBI recovery and may promote unit cohesion.

Exertion testing should be performed when a patient with TBI with previously functionally limiting symptoms, has recovered to a point where return to duty is considered. This ensures that symptoms do not recur with physical stress. When considering return to duty, it is recommended that the following criteria be met:

- Pass a physical fitness test (PFT)
- Pass “warrior training” if needed for duty
- Have anger, depression, PTSD and other psychological health issues controlled and monitored by the primary care clinician
- Have neuropsychological testing within functional limits as determined by a neuropsychological evaluation (including attention, memory, processing speed, executive function domains and others as previous deficits warrant) if cognitive impairment was noted during the assessment and treatment of mTBI.

After the above criteria are met, it is recommended that the Service member be placed on duty restrictions that state, “returned to duty with close command monitoring, non-deployable.” The trial of duty should last 30 days with at least 20 duty days. Following successful completion of a functional duty test, return to full duty including worldwide deployment is acceptable.

For patients with persistent symptoms, return to full duty in the jobs they have preformed may not be possible. Patients may need to proceed through the Medical Evaluation Board (MEB) process or they may need retraining or reclassification in order to be retained on active duty. For patients injured while serving in the National Guard or Reserves, consideration should be made to temporarily retain on active duty status to ensure they receive the care and benefits to which they are entitled. If released from duty, military/VA and civilian partner resources should be identified. MEB can be considered at six months for patients with chronic symptoms. If a patient requests MEB sooner, this request should be considered.

**Educational Treatment Initiatives**

Provision of TBI education early after diagnosis of mTBI has been shown to decrease symptom prevalence (Ponsford, 2002). Patient education, focused around the natural history of mTBI recovery that provides recommendations to facilitate sleep hygiene, coping strategies, stress management and avoidance of excessive alcohol and drug use would be most useful. Development and implementation of a provider education curriculum have been proposed for use throughout the Department of Defense (DoD). It is recommended that this curriculum be reviewed at least annually and updated as relevant new TBI research becomes available. Massive educational rollout activities are recommended to occur within the DoD to ensure that clinicians are adequately trained in the recognition and management of concussion/mTBI. Finally, command leadership would benefit from education regarding TBI to guide their decisions related to retention and redeployment in order to optimize force health and readiness.
Performance improvement parameters are needed to ensure the utilization of best practice and quality management. Separate consideration should be given for the educational and programmatic components. In the domain of education, patient satisfaction surveys should be included in all education tools. Providers should be given post–education assessments and continuing education credit should be offered. Program evaluation requires various performance metrics that can be measured between levels of care, service branches, and institutions. Data useful to program evaluation may include the following:

- MEB/Physical Evaluation Board (PEB) rates
- Return to duty rate (full duty/profile/days on profile)
- Patient quality of life
- Patient satisfaction
- Staff turnover
- Staff vacancies
- Access/waiting lists

The comments made in this document are general recommendations only. Attachments contain commonly used assessment tools. Other appropriate screening tools can be used. Sound clinical judgment should dictate the individual treatment plan.
Clinical Management Guidance for Mild Traumatic Brain Injury – Acute
Non-Deployed Care

**TRAUMATIC EVENT**
~Concussion Suspected~

1. Perform MACE
2. Confirm mTBI:
   a. **Injury Event** (blast, fall, motor vehicle collision (MVC), head impact)
   b. **Alteration of Consciousness** (dazed, confused or loss of consciousness even momentarily)

Evaluate for Red Flags:
Perform Neuro Exam
CT Scan
Administer Neurobehavioral Symptom Inventory (NSI)
Neurocognitive Assessment (NCA)

Are Red Flags present or is CT Scan positive?

**Yes**

Urgent referral to Neurology, Neurosurgery, or Emergency Room as appropriate

**No**

**Positive findings on Neuro Exam, NCA, or MACE Score <25 or symptoms from Item VIII?**

**Yes**

Primary Care Management
1. Manage symptoms (see mgmt grid)
2. Provide Education
3. Profile/Light Duty – 7 days
4. Re-evaluate symptoms (Item VIII) and re-administer NCA within 7 days
5. Consider Neurology referral if clinically indicated

**No**

Perform Exertional Testing

**Positive symptoms with exertional exercise testing?**

**Yes**

1. Provide Education
2. Profile – 7 days
3. Repeat exertional testing in 7 days

**No**

Perform Exertional Testing

**Positive symptoms on exertional testing?**

**Yes**

Repeat exertional testing & re-evaluate symptoms in 7 days

**No**

Reinforce Education
Return to Duty

Continued symptoms or abnormal NCA on re-evaluation?

**Yes**

Return to Duty

**No**

**Yes**

1. 30 day profile
2. Go to Sub-Acute CMG

**No**

Provide Education
Instruct to seek f/u if symptoms develop in 1-2 days
Return to Duty

**Red Flags:**
1. Progressively declining level of consciousness
2. Progressively declining neurological exam
3. Pupillary asymmetry
4. Seizures
5. Repeated vomiting
6. Double vision
7. Worsening headache
8. Cannot recognize people or disoriented to place
9. Behaves unusually or seems confused and irritable
10. Slurred speech
11. Unsteady on feet
12. Weakness or numbness in arms / legs

**Treatment:**
1. Give educational sheet to all mTBI patients.
2. Headache management - use Acetominophen.
3. Avoid tramadol, narcotics, NSAID’s, ASA, or other platelet inhibitors until CT confirmed negative.
4. **Exertional Testing Protocol**
   1. 65-85% Target Heart Rate (THR = 220-age)
   2. Using push-up, step aerobic, treadmill, hand crank
   3. Assess for symptoms (headache, vertigo, photophobia, balance, dizziness, nausea, tinnitus, visual changes, response to bright light or loud noise)

**Neurocognitive Assessment (NCA)**
(e.g. ANAM): If injury is over 24 hours old and if available.

**ICD-9 Codes**
850.0 concussion w/o LOC
850.11 Concussion w/ LOC <30 min
850.12 Concussion w/ LOC 31-59 min
E979.2 Injury from terrorist explosion blast

---

**Primary Care Management**

1. Manage symptoms (see mgmt grid)
2. Provide Education
3. Profile/Light Duty – 7 days
4. Re-evaluate symptoms (Item VIII) and re-administer NCA within 7 days
5. Consider Neurology referral if clinically indicated

---

**Exertional Testing Protocol**
1. 65-85% Target Heart Rate (THR = 220-age)
   1. Using push-up, step aerobic, treadmill, hand crank
   2. Assess for symptoms (headache, vertigo, photophobia, balance, dizziness, nausea, tinnitus, visual changes, response to bright light or loud noise)
Clinical Management Guideline Mild Traumatic Brain Injury – Sub-Acute

**Possible Sub-Acute mTBI (over 7 days post trauma)**

- High Risk Group:
  1. Injury caused by explosion
  2. Injury from fall, MVC, GSW above shoulders

**Evaluation:**
1. Administer Neurobehavioral Symptom Inventory (NSI) –
2. Record history – previous trauma / current exposure
3. Perform Neuro Exam
4. Administer Neurocognitive Assessment, e.g. ANAM
5. Identify Symptom Cluster(s) [Headache, Balance, Sleep, Irritability, Memory] –
6. Perform additional Symptom Cluster assessments as indicated – (see mgmt grid)

**Are Red Flags present?**
- Yes
  - 1. Urgent CT Scan
  - 2. Referral (as indicated by symptom cluster)
  - 3. Provide Education

- No
  - 1. Provide Education
  - 2. RTD

**Confirmed mTBI?**
- Yes
  - CT Scan Indicated?
    - Yes
      - Order CT Scan
      - Positive CT Scan?
        - Yes
          - 1. Neurology Referral (24 hr)
          - 2. Provide Education
        - No
          - Symptomatic?
            - Yes
              - 1. Manage symptom cluster – Pg. 2
              - 2. Provide Education
              - 3. Profile/Light duty – up to 3 months
              - 4. Periodic re-evaluation (e.g., every 3 months)
              - 5. Determine final disposition at 12 months or sooner
            - No
              - 1. Provide Education
              - 2. RTD

    - No
      - 1. Provide Education
      - 2. RTD

- No
  - 1. Provide Education
  - 2. RTD

**mTBI Disposition Decision**

<table>
<thead>
<tr>
<th>Symptomatic</th>
<th>Disabling Symptoms</th>
</tr>
</thead>
</table>
| Retain | 1. Gather collateral information: ANAM, time in service, unit & family feedback
| 2. Ensure sufficient trial of OT/PT |
| Rehab | 7. Consider MEB – 12 months with collateral information
| 2. Initiate MEB – NLT 12 months |
| No Change | 1. Profile/Light duty up to 3 months
| 3. Periodic re-evaluation (e.g., every 3 months)
| 4. Determine final disposition at 12 months or sooner |
| Worsening | 1. Consider MEB – 6 months with collateral information
| 2. Initiate MEB – NLT 12 months |

**ICD-9 Codes**
- 850.0 concussion w/o LOC
- 850.11 Concussion w/ LOC <30 min
- 850.12 Concussion w/ LOC 31-59 min
- E979.2 Injury from terrorist explosion blast

**a** [Red Flags]:
1. Progressively declining level of consciousness
2. Progressive declining neurological exam
3. Pupillary asymmetry
4. Seizures
5. Repeated vomiting
6. Double vision
7. Worsening headache
8. Cannot recognize people or disoriented to place
9. Behaves unusually or seems confused and irritable
10. Slurred speech
11. Unsteady on feet
12. Weakness or numbness in arms / legs

**Confirm mTBI:**
1. Injury Event (blast, fall, MVC, head impact) AND
2. Alteration of Consciousness (dazed, confused or loss of consciousness even momentarily)

**CT Scan Criteria:** If not already obtained, CT Scan is indicated in mTBI patients with headache, vomiting, drug or alcohol intoxication, deficits in short term memory, physical evidence of trauma above the clavicle, dizziness, disequilibrium, or age >60.
Attachment 2

Suggested Tools for Evaluation
| Symptom Cluster | Presenting Symptoms or Complaints | Special Assessment related to complaint | Assessment Red Flags And Immediate Referral | Treatment Options by Symptom Cluster 
NOTE: Treat headache, sleep & irritability first as other symptoms often improve with pain control & rest 
Inclusion does not imply FDA approved use. See full prescribing information. |

Attachment

**Headache**

**Episodic Headache**
- Characterize type
- Abortive therapy
  - Maximum 6 doses/week

**Chronic Daily Headache**
- > 15 HA days per month
- Analgesic rebound
- Prophylaxis is key

*Abortive*

Avoid Narcotics & Benzodiazepines

*Prophylaxis*
Onset of action ~ 4 wks

**NSAIDs**
- GI side effects
  - Ibuprofen
  - Naproxen
  - Sodium Acetaminophen
  - Aspirin

**Triptans**
- Contraindicated in patients with CAD
  - Fioricet
  - Fiorinal
  - Midrin

**Combination Medications**
- Cognitive side effects
  - Risk of W/D

**Alternatives**
- Promethazine
  - Metoclopramide
  - Prochlorperazine
  - Tizanidine
  - Non-medications
  - Trigger point injection
  - Occipital nerve block
  - Physical therapy

**Anti-depressants**
- May improve mood
- Improves sleep
  - Nortriptyline
  - Amitryptiline
  - Paroxetine
  - Fluoxetine

**Anti-epileptics**
- Neuropathic pain
- Gabapentin
- Mood lability
  - Valproic acid
  - Topirimate

**Beta-blockers**
- Non-selective may have benefit on autonomic effects of PTSD
  - Propranolol

**Avoid Narcotics & Benzodiazepines**

**DVBIC/DCoE MAY08**
**Neurobehavioral Symptom Inventory (NSI)**

Please rate the following symptoms with regard to how much they have disturbed you IN THE LAST 2 Weeks. The purpose of this inventory is to track symptoms over time. Please do not attempt to score.

0 = None – Rarely if ever present; not a problem at all

1 = Mild – Occasionally present, but it does not disrupt my activities; I can usually continue what I’m doing; doesn’t really concern me.

2 = Moderate – Often present, occasionally disrupts my activities; I can usually continue what I’m doing with some effort; I feel somewhat concerned.

3 = Severe – Frequently present and disrupts activities; I can only do things that are fairly simple or take little effort; I feel I need help.

4 = Very Severe – Almost always present and I have been unable to perform at work, school or home due to this problem; I probably cannot function without help.

PTSD Checklist – Military Version (PCL – M)

Instruction to patient: Below is a list of problems and complaints that veterans sometimes have in response to stressful military experiences. Please read each one carefully, fill in the circle to indicate how much you have been bothered by that problem in the last month.

1 = Not at all
2 = A little bit
3 = Moderately
4 = Quite a bit
5 = Extremely

PHQ-9 QUICK DEPRESSION ASSESSMENT

For initial diagnosis:

1. Patient completes PHQ-9 Quick Depression Assessment on accompanying tear-off pad.
2. If there are at least 4 ✓'s in the blue highlighted section (including Questions #1 and #2), consider a depressive disorder. Add score to determine severity.
3. **Consider Major Depressive Disorder**
   —if there are at least 5 ✓'s in the blue highlighted section (one of which corresponds to Question #1 or #2)
4. **Consider Other Depressive Disorder**
   —if there are 2 to 4 ✓'s in the blue highlighted section (one of which corresponds to Question #1 or #2)

**Note:** Since the questionnaire relies on patient self-report, all responses should be verified by the clinician and a definitive diagnosis made on clinical grounds, taking into account how well the patient understood the questionnaire, as well as other relevant information from the patient. Diagnoses of Major Depressive Disorder or Other Depressive Disorder also require impairment of social, occupational, or other important areas of functioning (Question #10) and ruling out normal bereavement, a history of a Manic Episode (Bipolar Disorder), and a physical disorder, medication, or other drug as the biological cause of the depressive symptoms.

To monitor severity over time for newly diagnosed patients or patients in current treatment for depression:

1. Patients may complete questionnaires at baseline and at regular intervals (eg, every 2 weeks) at home and bring them in at their next appointment for scoring or they may complete the questionnaire during each scheduled appointment.
2. Add up ✓'s by column. For every ✓: Several days = 1; More than half the days = 2; Nearly every day = 3
3. Add together column scores to get a TOTAL score.
4. Refer to the accompanying PHQ-9 Scoring Card to interpret the TOTAL score.
5. Results may be included in patients’ files to assist you in setting up a treatment goal, determining degree of response, as well as guiding treatment intervention.

**PHQ-9 SCORING CARD FOR SEVERITY DETERMINATION**

**Scoring—add up all checked boxes on PHQ-9**

**For every ✓:** Not at all = 0; Several days = 1;
More than half the days = 2; Nearly every day = 3

**Interpretation of Total Score**

</table>
The following questions concern information about your potential involvement with drugs not including alcoholic beverages during the past 12 months. Carefully read each statement and decide if your answer is "Yes" or "No". Then, circle the appropriate response beside the question.

In the statements "drug abuse" refers to (1) the use of prescribed or over the counter drugs in excess of the directions and (2) any non-medical use of drugs. The various classes of drugs may include: cannabis (e.g. marijuana, hash), solvents, tranquilizers (e.g. Valium), barbiturates, cocaine, stimulants (e.g. speed), hallucinogens (e.g. LSD) or narcotics (e.g. heroin). Remember that the questions do not include alcoholic beverages.

Please answer every question. If you have difficulty with a statement, then choose the response that is mostly right.

©1982 by the Addiction Research Foundation. Author: Harvey A. Skinner Ph.D.

For information on the DAST, contact Dr. Harvey Skinner at the Addiction Research Foundation, 33 Russell St., Toronto, Canada, M5S 2S1.
These questions refer to the past 12 months.

Circle your response

1. Have you used drugs other than those required for medical reasons? .............. Yes No
2. Have you abused prescription drugs? ................................................................. Yes No
3. Do you abuse more than one drug at a time? ..................................................... Yes No
4. Can you get through the week without using drugs? .......................................... Yes No
5. Are you always able to stop using drugs when you want to? ............................ Yes No
6. Have you had "blackouts" or "flashbacks" as a result of drug use? .................... Yes No
7. Do you ever feel bad or guilty about your drug use? .......................................... Yes No
8. Does your spouse (or parents) ever complain about your involvement with drugs? ................................................................. Yes No
9. Has drug abuse created problems between you and your spouse or your parents? .................................................................................................................................. Yes No
10. Have you lost friends because of your use of drugs? ...................................... Yes No
11. Have you neglected your family because of your use of drugs? ....................... Yes No
12. Have you been in trouble at work because of drug abuse? .............................. Yes No
13. Have you lost a job because of drug abuse? ...................................................... Yes No
14. Have you gotten into fights when under the influence of drugs? ....................... Yes No
15. Have you engaged in illegal activities in order to obtain drugs? ........................ Yes No
16. Have you been arrested for possession of illegal drugs? ................................... Yes No
17. Have you ever experienced withdrawal symptoms (felt sick) when you stopped taking drugs? ................................................................. Yes No
18. Have you had medical problems as a result of your drug use (e.g. memory loss, hepatitis, convulsions, bleeding, etc.)? ................................. Yes No
19. Have you gone to anyone for help for a drug problem? .................................... Yes No
20. Have you been involved in a treatment program specifically related to drug use? ........................................................................................................ Yes No

DHI Scoring Instructions

The patient is asked to answer each question as it pertains to dizziness or unsteadiness problems, specifically considering their condition during the last month. Questions are designed to incorporate functional (F), physical (P), and emotional (E) impacts on disability.

To each item, the following scores can be assigned:
No=0  Sometimes=2  Yes=4

Scores:
Scores greater than 10 points should be referred to balance specialists for further evaluation.

16-34 Points (mild handicap)
36-52 Points (moderate handicap)
54+ Points (severe handicap)
Epworth Sleepiness Scale

How likely are you to doze off or fall asleep in the situations described below, in contrast to feeling just tired? This refers to your usual way of life in recent times. Even if you haven't done some of these things recently try to work out how they would have affected you.

Score the chance that you would doze off in the following situations based on the scale:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Chance of dozing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sitting and reading</td>
<td></td>
</tr>
<tr>
<td>Watching TV</td>
<td></td>
</tr>
<tr>
<td>Sitting, inactive in a public place (e.g. a theatre or a meeting)</td>
<td></td>
</tr>
<tr>
<td>As a passenger in a car for an hour without a break</td>
<td></td>
</tr>
<tr>
<td>Lying down to rest in the afternoon when circumstances permit</td>
<td></td>
</tr>
<tr>
<td>Sitting and talking to someone</td>
<td></td>
</tr>
<tr>
<td>Sitting quietly after a lunch without alcohol</td>
<td></td>
</tr>
<tr>
<td>In a car, while stopped for a few minutes in the traffic</td>
<td></td>
</tr>
</tbody>
</table>

**Scoring:**
0-10 Normal range
10-12 Borderline
12-24 Abnormal
